

COP 4710, Fall 2009, Homework 3

Problem I.

(a) Proof:

(1)  $W \rightarrow Y$  (given)

(2)  $X \rightarrow Z$  (given)

(3)  $WX \rightarrow YX$  (using IR2 (augmentation) to augment (1) with X)

(4)  $YX \rightarrow Y$  (using IR1 (reflexivity), knowing that  $Y \subseteq YX$ )

(5)  $WX \rightarrow Y$  (using IR3 (transitivity) on (3) and (4))

(b) Proof:

(1)  $X \rightarrow Y$  (given)

(2)  $Y \rightarrow Z$  (using IR1 (reflexivity), given that  $Z \subseteq Y$ )

(3)  $X \rightarrow Z$  (using IR3 (transitivity) on (1) and (2))

(c) Proof:

(1)  $X \rightarrow Y$  (given)

(2)  $X \rightarrow W$  (given)

(3)  $WY \rightarrow Z$  (given)

(4)  $X \rightarrow XY$  (using IR2 (augmentation) to augment (1) with X)

(5)  $XY \rightarrow WY$  (using IR2 (augmentation) to augment (2) with Y)

(6)  $X \rightarrow WY$  (using IR3 (transitivity) on (4) and (5))

(7)  $X \rightarrow Z$  (using IR3 (transitivity) on (6) and (3))

(d) Proof:

(1)  $X \rightarrow Y$  (given)

(2)  $XY \rightarrow Z$  (given)

(3)  $X \rightarrow XY$  (using IR2 (augmentation) to augment (1) with X)

(4)  $X \rightarrow Z$  (using IR3 (transitivity) on (3) and (2))

Problem II.  $\{AC\}^+ = \{A, B, C, D, E\}$

A, C, F only appear on the left hand side of a FD, so we need to start by computing  $\{ACF\}^+$  to find the key. It happens  $\{ACF\}^+$  contains all attributes of R so ACF is the key. This is the only key.

Problem III. A minimal set of attributes whose closure includes all the attributes in R is a key. Since the closure of  $\{A, B\}$ ,  $\{A, B\}^+ = R$ , one key of R is  $\{A, B\}$  (in this case, it is the only key).

First, we can test if the schema violates 2NF. This means we want to see if there are non-prime attributes that are functionally dependent on either parts of the key,  $\{A\}$  or  $\{B\}$ , alone.

We can calculate the closures  $\{A\}^+$  and  $\{B\}^+$  to determine such attributes:

$\{A\}^+ = \{A, D, E, I, J\}$ . Hence  $\{A\} \rightarrow \{D, E, I, J\}$  ( $\{A\} \rightarrow \{A\}$  is a trivial dependency)

$\{B\}^+ = \{B, F, G, H\}$ , hence  $\{B\} \rightarrow \{F, G, H\}$  ( $\{B\} \rightarrow \{B\}$  is a trivial dependency). For both A and B, we can find attributes that depend on them. Therefore, R violates 2NF. It only satisfies

1NF as it does not contain multivalued attributes.

Problem IV. From the question's text, we can infer the following functional dependencies:

$\{\text{Doctor\#}, \text{Patient\#}\} \rightarrow \{\text{Diagnosis}\}$

$\{\text{Treat\_code}\} \rightarrow \{\text{Charge}\}$

Therefore,  $\{\text{Doctor\#}, \text{Patient\#}, \text{Date}, \text{Treat\_code}\}$  is the key. Since  $\{\text{charge}\}$  is dependent on a subset of the key, this violates 2NF.
